**Announcements – 24 Sep 2009**

1. **Exam 2 is coming up!**
   a. Exam begins next week on Thurs, runs through the following Wednesday
   b. Covers Chapters 4 & 5, Homeworks 4-8

2. **Clicker quiz: (do this before class) TA-led exam review session next week**…when should it be? Please enter your top choice:
   a. Wed 6 – 7:30 pm
   b. Wed 7 – 8:30 pm
   c. Wed 8 – 9:30 pm
   d. Thurs 6 – 7:30 pm
   e. Thurs 7 – 8:30 pm
   f. Thurs 8 – 9:30 pm

   Remember to send me suggestions about the review session if you want anything done differently.

---

**Worked Problem (from last time):** You invent a new Olympic sport called pulley ski jumping. If the kinetic coefficient of friction is \( \mu \), what is your acceleration?

---

**New topic: Work**

**Demo:** Moving a cart at constant velocity

**Question:** Who did the most “work”?  
   a) the one who lifted the cart  
   b) the one who moved the cart horizontally  
   c) same work done

**Definition of work in physics:**

\[
W = F_x \Delta x 
\]

(not a vector!)

The work done by a force on an object is the component of the force along the direction of motion (“\( F_x \)” times the magnitude of the object’s displacement.

Disclaimer: only true if the force is constant, otherwise you need to use the average force. Or, in extreme cases, calculus.

**From warmup:** What if cart is carried instead of pushed?

**SI Units:** 1 N \( \times \) 1 meter = 1 Joule

Recall: 1 N = 1 kg m/s\(^2\) … units start getting pretty complicated

---

**Positive vs. Negative**

**Positive** if force is in line with motion \( \rightarrow \) adds energy to object

**Negative** if force is opposite the motion \( \rightarrow \) removes energy

**Zero** if force is perpendicular to the path \( \rightarrow \) energy unchanged

**Force at some angle?** Use parallel component

**Clicker quiz:** A girl pulls a sled up a hill at constant speed. Which forces do negative work on the sled?  
   a. No forces do negative work  
   b. Friction only  
   c. Friction and gravity  
   d. Friction, gravity, and the normal force

**What is energy?**

Wikipedia: “The ability to do work…”  
\( \rightarrow \) exert a force over a distance
**Kinetic energy**
Defn: Object’s ability to do work that comes from its motion.

$$KE = \frac{1}{2} m v^2$$

**Derivation:**

Ball in motion, sticks to block

Ball pushes block a distance $\Delta x$

Block provides constant stopping force $F$

What is $\Delta x$? Use Kinematics… $v_f^2 = v_0^2 + 2a\Delta x$

$$0 = v^2 + 2 \left( -\frac{F}{m} \right) \Delta x$$

$$\Delta x = \frac{mv^2}{2F}$$

How much work does the object do as it stops?

$$W = F\Delta x$$

$$= F \left( \frac{mv^2}{2F} \right)$$

$$= \frac{1}{2}mv^2$$

---

**Worked problem:** A boy pulls his toy mass $m$ with a force $P$, at an angle $\theta$ above the horizontal. He moves the toy a distance $D$ along the ground without friction.

If the initial velocity of the toy was $v_0$, how fast was it going after it moved $D$?

**Method 1:** The old way
a. Use N2 to figure out acceleration
b. Use kinematics equations to figure out final speed, time, or whatever is wanted.

**Method 2. Conservation of energy**

---

**Why use work/energy?**

→ It is often easier!

Some problems that are hard using Newton’s 2nd law can be worked easily with energy ideas, if you don’t need to know ________________________!

---

**Law of Conservation of Energy**

$$E_{before} + W = E_{after}$$

aka “Work-Energy theorem”

---

**Problem:** You pull on a 60 kg load with a force of 80 N at an angle 30 degrees above horizontal. It starts from rest, and after traveling 12 meters, it’s going 3 m/s. There is also some work done by friction.

**Question:** Was the net work done on the wagon positive, negative, or zero?

**Clicker quiz:** What work did you do on the wagon? (From your force)

- a. 0-100 J
- b. 100-200 J
- c. 200-300 J
- d. 300-400 J
- e. 400+ J

**Clicker quiz:** What was the net work done by all the forces on the wagon? (Hint: from change in KE)

- a. 0-100 J
- b. 100-200 J
- c. 200-300 J
- d. 300-400 J
- e. 400+ J

**Question:** What was the work done by friction on the wagon?

**Answer:** -561 J
Gravitational potential energy

$PE_{\text{gravity}}$ keeps track of the ______ done against gravity

**Formula:** $PE = mgy$

_Derivation:_ work = force $\times$ distance

Change in PE for the different paths?

From warmup: The amount of potential energy possessed by an elevated object is equal to
a. the distance it is lifted
b. the force needed to lift it
c. the work done in lifting it
d. it's acceleration due to gravity

“Conservative” vs. “nonconservative” forces:
What happens to the energy when you brake your car?
Other forms of energy?

**Problem:** You throw a ball straight up with an initial velocity of 11 m/s. How high does it go?

**Method 1:** kinematics

**Method 2:** energy

**Question:** How long does it take?
→ Can only be done with kinematics

**Demo:** Duckpin ball pendulum

**Video:** Triple Track

**Video:** Pole Vaulter

Simple Analysis: How high can pole jumpers jump?
Top velocities: ~11 m/s for short distances

_Compare:_ Pole vault world record: 6.14 m
Answer: 6.17 m

Conservation of Energy, revisited

“Energy cannot be created or destroyed, only changed from one form into another…” [mostly true]

$E_{\text{before}} + W = E_{\text{after}}$

“Law of conservation of energy”

Statement one:

$KE_{\text{bef}} + W = KE_{\text{aft}}$

_W must include work done by all forces_

Statement two:

$KE_{\text{bef}} + PE_{\text{bef}} + W = KE_{\text{aft}} + PE_{\text{aft}}$

_W includes only work by nonconservative forces_

Both cases: W can be positive or negative, and can contain multiple work terms (one for each appropriate force)

Clicker quiz: You throw three balls from a cliff over the ocean with the same initial speed. One is thrown straight up, one straight down, and one horizontally. Ignoring air resistance, which ball has the highest speed just before it hits the ocean?

a. thrown straight up
b. thrown straight down
c. thrown horizontally
d. all the same speed

_Demo:_ Racing balls

Clicker quiz: Which ball will win the race?

a. The ball that dips down
b. The ball that doesn’t dip down

From warmup: A car coasting from rest down two hills, one steeper than the other, will arrive at the bottom of each hill with the same speed, as long as the two hills have the same vertical height (neglecting friction & air resistance). Ralph wondered how this could be possible, since as we learned in class the acceleration of the car down the steep hill will be greater than down the other hill. What should you tell him?

Answer from the class:
**Demo:** Cart being pulsed on track

**Demo problem:** Dr Colton hangs a _____ kg mass from a pulley and attaches it to a ______ kg cart with a string. He lets the hanging mass fall ______ m. How fast is the cart going at the end?

**Check:** How long does it take to go there?

---

**Clicker quiz (if we have time):** A 500 kg car starts from rest on a track 100 m above the ground. It does a loop-de-loop that is 25 m from the ground at the top. There is no friction. How fast is it going at the top of the loop?

- a. 0-10 m/s
- b. 10-20
- c. 30-40
- d. 40-50
- e. 50+ m/s

Does it depend on mass?

**Could you do this with N2?**
